

## Scenario:

You are a single parent who works 12 hour shifts and struggles to find the time to shop and get dinner for the kids. You download the Coronavirus Comfort app in hopes of finding a convenient way to solve your dilemma.

Task 1: Search for frozen pizza and find a store selling it nearby. Add this product to your favorites page (The prototype must be extended for this).

Task 2: While searching for frozen pizza, navigate to the page of the store that is selling it and find directions to the store.

Task 3: Find the closest store to you that is open and check to see if they sell Pepsi. Add this store to the favorites page.

## Notes

What changes should be made:

- The function for adding to the favorites tab should be plainly visible on both the store page and the product page.
- Need a “visit store page” button instead of just clicking on the name of the store.
- The map tab should display whether nearby stores are closed or open without having to click on them.
- Create a search button located on the grocery list?

What should stay the same:

- The favorites tabs received positive feedback and should be kept for sure.
- Directions within the app are convenient and simple.
- The ratings system for reviews and cleanliness of stores received highly positive feedback.
